Date

Stormwater Pollution Prevention Team

The following personnel are responsible for implementing this Stormwater Pollution Prevention Plan (SWPPP). The Station Supervisor is responsible for ensuring that there is a current SWPPP for this facility.

| <u>Name</u> | <u>Position</u> | <u>Role</u> | <u>Reference in SWPPP</u> |
|--------------|---------------------------------------|---|---------------------------------------|
| Von Bowerman | Station Supervisor | Manages daily operations at the facility, updates facility SWPPP, documents any inhouse stormwater related training in SWPPP | 1.5, 3.4, 4.1, 5, Attachments B, E, F |
| Chet Johnson | Area Supervisor | Oversees maintenance facilities within their area, primary contact for spills within their area | 4.1, 5, Attachment B |
| Jared Barton | Region Stormwater Program Coordinator | Notified of any issues, needs or questions regarding stormwater and stormwater infrastructure at the facilities in their region | 4.1, 5, Attachment B |

1 INTRODUCTION

This Stormwater Pollution Prevention Plan (SWPPP) has been prepared for this maintenance station in general accordance with the requirements of the Utah Department of Transportation (UDOT) Stormwater Management Program (SWMP) to comply with the Utah Pollutant Discharge Elimination System (UPDES) Permit. The Permit requires the preparation of SWPPPs for maintenance stations. The SWPPP identifies potential pollutants and tailored standard operating procedures (SOPs) that include best management practices (BMPs) that, when implemented at the facility, will have the ultimate goal of preventing or reducing the discharge of pollutants from this facility. This SWPPP also includes information on the required inspections to be conducted at the facility.

1.1 SWPPP Purpose

The purpose of the SWPPP is to identify the activities conducted at the maintenance station and the stormwater SOPs that will be implemented to reduce the discharge of pollutant runoff from the facility. This SWPPP provides a site-specific description of stormwater pollution prevention practices at this facility.

Under the MS4 Permit, UDOT is required to reduce the discharge of pollutants associated with stormwater drainage from UDOT-owned facilities. This SWPPP is a planning, evaluating, implementing and reporting tool that is used to ensure compliance with UDOT's MS4 Permit.

1.2 SWPPP Objectives

This SWPPP has been developed to meet the following objectives:

- Identify pollutant sources that may affect the quality of stormwater discharges;
- Identify potential pathways and conveyances for pollutants to discharge from the facility;
- Identify and implement SOPs that include best management practices to reduce or prevent pollutants in stormwater discharges.

1.3 Pollutants

The MS4 Permit requires that the SWMP address, at minimum, typical pollutants found at UDOT facilities and operations. These pollutants are:

- Total suspended solids
- Sediment
- Petroleum products
- Pesticides and herbicides
- Chlorides
- Heavy metals (e.g., zinc, lead)
- Bacteria
- Chlorine
- Organic matter

SWPPPs developed for UDOT owned or operated facilities identify potential sources of pollution that may reasonably be expected to affect the quality of stormwater discharges associated with activity from the facility and include BMPs to reduce or eliminate pollutants in stormwater runoff.

1.3.1 Description of Potential Pollutant Sources

There are potential pollutant sources that can exist in different areas around the maintenance station. Potential areas of concern at a maintenance facility include:

- Fixed fueling operations
- Vehicle and equipment maintenance and/or cleaning areas
- Brine making areas
- Loading/unloading areas
- Waste storage or disposal areas
- Liquid Storage tanks
- Process and equipment operating areas
- Storage or disposal areas for significant materials
- Operations that have the potential to discharge pollutants into stormwater conveyance systems that leave the site

To identify the locations of potential pollutant sources at the station, please refer to the Site Map in Attachment A.

1.4 SWPPP Availability

This SWPPP will be maintained at this facility and will be made available to a representative of the Utah Division of Water Quality (DWQ), the US Environmental Protection Agency (USEPA) and/or other local agency if requested.

1.5 SWPPP Revisions

The individuals listed on the Stormwater Pollution Prevention Team Page of this SWPPP are responsible for ensuring that any changes in design, construction, operation, or maintenance activities at the station do not cause the discharge of pollutants to surface water, groundwater, or a municipal separate storm sewer system (MS4). This SWPPP will be revised if it is in violation of any condition of the Permit, has not achieved the general objective of reducing pollutants in stormwater discharges, or whenever the DWQ requires revision of the SWPPP. Additionally, the Station Supervisor is responsible for ensuring the SWPPP is revised as activities and SOPs change.

2 MAINTENANCE FACILITY INFORMATION

This section of the SWPPP provides a general description of the maintenance station.

A road maintenance crew is stationed at this facility. Some utility supplies are stored on site. Maintenance vehicles required to support the highway activities conducted from this maintenance station are stored at this site.

2.1 Property Information

Described below is property information for the Thompson Maintenance Station. All elevations are referenced to mean sea level. Latitude and Longitude are in decimal degrees. A facility site map is located in Attachment A of this SWPPP.

| | |
|----------------------------------|-------------|
| Street Address | 431 Hwy 94 |
| City | Thompson |
| State | Utah |
| Zip Code | 84540 |
| County | Grand |
| Facility Acreage (acres) | 10 |
| Facility Elevation (feet) | 5212 |
| Latitude | 38.9664° |
| Longitude | -109.7150 ° |

2.2 Topological Features

The Thompson Maintenance Station is located along Hwy 94 within Thompson, Utah. Half of the property is paved, with the other half set to be paved by FY 2020 or 2021. The site generally slopes to the northwest.

2.3 Environmental Areas and Surface Water Bodies

This facility is located nearby the Thompson Wash. Although this water body may not be considered impaired, any pollutants that are generated or runoff from this facility may contribute to the impairment of this or any water body that it flows to. Only clean stormwater and snow melt are allowed to leave this facility through the storm drainage system.

2.4 Water Supply and Site Wells

Water is supplied to the site by the Thompson Canyon Spring.

2.5 Stormwater Conveyance and Treatment BMPs

The Thompson Maintenance Station has a general surface stormwater flow to the northwest. Floor drains inside the main building lead to an oil-water separator and then to a holding tank.

Treatment BMPs are defined as permanent stormwater treatment measures to improve stormwater quality. Treatment BMPs at the Thompson Maintenance Station include: a retention basin and an oil-water separator.

2.6 Wash Water Conveyance

The wash rack at the station is located adjacent to the retention basin. All wash water sheet flows directly to the basin.

2.7 Sewage Conveyance

Sanitary waste from the facility is discharged to a private sewage disposal system consisting of a baffled septic tank and a leach field. Effluent from the septic tank is discharged to a leach field.

The Station Supervisor will keep the list of chemicals in Section 3.4 current and up to date. For any questions about restrictions regarding discharges to the septic tank system, please contact your local health department. Contact information for the local health department can be found in Attachment B in the Maintenance Emergency Call Down List.

3 MAINTENANCE FACILITY ACTIVITIES AND BMPS

This section identifies the activities conducted at the maintenance station and the BMPs to be implemented to reduce and/or eliminate the discharge of pollutants in stormwater runoff from the facility.

3.1 Activities

The Thompson Maintenance Station is a staging area for the routine and emergency repair and upkeep of the state highway system within the State of Utah. The maintenance station's primary activities are to store equipment, tools, raw materials, roadway waste materials, loading and unloading of materials, equipment repair, equipment cleaning and equipment fueling.

3.1.1 Operations and Maintenance Program – Standard Operating Procedures

The Operations and Maintenance program for UDOT maintenance stations include Standard Operating Procedures for the following items:

- use, storage and disposal of chemicals
- spill prevention plans
- dumpster and waste management
- cleaning, washing, painting and other activities
- parking lot and facility cleaning (sweeping & schedules)
- inventory of floor drains and discharge locations
- salt and other deicing materials
- brine making operations
- application, storage and disposal of pesticides and herbicides
- vehicle cleaning, maintenance and storage
- wastewater disposal
- fueling operations
- detention and retention basin management
- guidance documents for the Operations and Maintenance Program may be found in the Standard Operating Procedures & Resources (Attachment B)

3.1.2 SOPs for Salt and Other Deicing Materials

Storage piles of salt or other materials used for deicing are enclosed or covered to prevent exposure to precipitation. Materials should be prevented from physically leaving the maintenance station. For further guidance, see the SOP for Salt Storage (Attachment B).

Salt at the station is stored inside a shed and brine is stored inside liquid storage tanks. Both are stored within the drainage area of the retention basin. The retention basin does not discharge to receiving waters.

3.1.3 SOPs for Vehicles and Equipment

Vehicle and equipment repair, storage and maintenance must be conducted in a manner to prevent the discharge of contaminants from the site. For further guidance see the SOPs for Vehicle and

Equipment Fueling, Vehicle and Equipment Washing and Vehicle and Equipment Maintenance (Attachment B).

Vehicles at the station are stored indoors and outdoors. Absorbents are readily available on site. The fueling area is in the northwest part of the site (for more details, see Attachment B—Vehicle and Equipment Fueling SOP). Mechanical work is completed inside the main building. Vehicles are washed at the wash rack where wash water sheet flows directly into the retention basin.

3.2 Pollutant Sources and Best Management Practices

Maintenance BMPs are pollution prevention measures designed to reduce the discharge of pollutants associated with maintenance activities. The maintenance station has implemented BMPs for each maintenance activity identified in Section 3.1. Based on the activities conducted, a list of potential pollutant sources, pollutants, locations, and applicable BMPs has been compiled in Attachment B of the SWPPP. The BMPs identified in the SOPs for this facility are considered appropriate and are implemented on an activity-by-activity basis. Details describing the BMPs that relate to the facility specific SOPs are provided in Attachment B including description, appropriate application, and list of pollutants each BMP helps minimize.

Table 1: Potential Pollutant Sources at the Thompson Maintenance Station, Pollutants of Concern, Location, BMPs and BMP Reference

| Potential Pollutant Sources | Pollutants of Concern | | | | | | | | | | FW* = Facility Wide | | |
|--|-----------------------|---------------|-------------------|--------------|----|-----------|-----------|------------|-------------------------|-----------|---------------------------|---|------------------------------------|
| | Petroleum Products | TSS/Sediments | Litter and Debris | Heavy Metals | pH | Nutrients | Pathogens | Pesticides | Solvents/ Degreasers | Chlorides | Map Location Attachment A | Describe BMPs in Place | BMP Reference Attachment C |
| Building and Grounds Maintenance | X | X | X | | | | | | | X | FW* | Building and grounds maintenance activities are conducted in a careful manner to ensure pollutants are not discharged into the storm drains. | MS-1, MS-2, MS-5, MS-6, MS-7, MS-9 |
| Vehicle & Equipment Parking | X | | | X | X | | | | | | 2D, 3D | Spill cleanup materials are utilized in the event of vehicle or equipment leaks or spills. Used absorbent or other clean-up materials are disposed of properly. | MS-16 |
| Vehicle & Equipment Washing & Steam Cleaning | X | X | X | X | | X | | | | X | 2E | The wash rack drains to the retention basin. | MS-15 |
| Vehicle & Equipment Maintenance & Repair | X | | | X | | X | | | X | | 2D, 3D | Maintenance and repair activities are conducted indoors. Petroleum products, solvents, degreasers, and other automotive fluids used during maintenance and repair are kept inside the shops or within covered secondary containment. Spill kits equipped with dry sweep absorbent and absorbent pads are utilized in the event of a spill. Used absorbent or other clean-up materials are disposed of properly. | MS-16 |
| Vehicle & Equipment Fueling | X | | | | | | | | | | 2D | Vehicle and equipment fueling activities are performed in designated areas | MS-14 |

Table 1: Potential Pollutant Sources at the Thompson Maintenance Station, Pollutants of Concern, Location, BMPs and BMP Reference

| Potential Pollutant Sources | Pollutants of Concern | | | | | | | | | | FW* = Facility Wide | | |
|--|-----------------------|---------------|-------------------|--------------|----|-----------|-----------|------------|-------------------------|-----------|---------------------------|---|----------------------------|
| | Petroleum Products | TSS/Sediments | Litter and Debris | Heavy Metals | pH | Nutrients | Pathogens | Pesticides | Solvents/ Degreasers | Chlorides | Map Location Attachment A | Describe BMPs in Place | BMP Reference Attachment C |
| | | | | | | | | | | | | where spill kits are readily available. Dry sweep absorbent and absorbent pads are utilized in the event of a spill. Used absorbent or other clean-up materials are disposed of properly. | |
| Outdoor Loading & Unloading of Materials & Tools | X | X | X | X | X | X | | | | X | 2F | Spills or leaks resulting from outdoor material loading/unloading are cleaned immediately. Spill kits equipped with dry sweep absorbent and absorbent pads are utilized in the event of a spill. Used absorbent or other clean-up materials are disposed of properly. | MS-7, MS-9, MS-13 |
| Outdoor Storage of Raw Materials | X | X | X | X | X | X | | | | | 3F, 4D | No BMP's in place. | MS-2, MS-7, MS-12, MS-13 |
| Roadway Waste Handling & Disposal | X | X | X | X | X | X | | | | | 2D | When possible, roadway waste is accumulated and sorted in covered dumpsters. Surrounding areas are swept as needed. | MS-10, MS-11, MS-13 |
| Storage of Hazardous Materials | X | X | X | X | X | X | | X | | | 2D, 2F, 3D, 3F, 4F | All hazardous materials are stored indoors or within covered secondary containment. | MS-3 |
| Pesticide Storage | | | | | X | | | X | | | 2F, 3F | Pesticides are stored indoors. | MS-3 |
| Pesticide Use and Mixing | | | | | X | | | X | | | 2E | Pesticides are used and mixed according to manufacturer | MS-1, MS-11 |

Table 1: Potential Pollutant Sources at the Thompson Maintenance Station, Pollutants of Concern, Location, BMPs and BMP Reference

| Potential Pollutant Sources | Pollutants of Concern | | | | | | | | | | FW* = Facility Wide | | |
|--|-----------------------|---------------|-------------------|--------------|----|-----------|-----------|------------|-------------------------|-----------|---|----------------------------------|----------------------------|
| | Petroleum Products | TSS/Sediments | Litter and Debris | Heavy Metals | pH | Nutrients | Pathogens | Pesticides | Solvents/ Degreasers | Chlorides | Map Location Attachment A | Describe BMPs in Place | BMP Reference Attachment C |
| | | | | | | | | | | | specifications. Mixing operations are conducted at the wash rack to ensure spills are captured and discharged to the retention basin. | | |
| Portable Sewage: Restrooms/RV Dump Station/Maintenance | | | | | X | | X | | | | 2D, 3D | The restroom is located indoors. | MS-8 |

3.3 Non-Hazardous Materials Storage

Based on the activities conducted at the facility, the following non-hazardous materials are stored outdoors.

| Non-Hazardous Material | Location on Site Map | BMPs |
|------------------------|--------------------------------|-----------------------------|
| Aggregate | 3F, 4D | No BMPs in place |
| Treated Wood | 2E, 2F, 3F, 4E, 4F | No BMPs in place |
| Heavy Equipment Parts | 2C, 2D, 3C, 3D | No BMPs in place |
| Trash | 2D | Stored in covered dumpsters |
| Steel/Sheet Metal | 2E, 2F, 3C, 3D, 4C, 4D, 4E, 4F | No BMPs in place |
| Rubber | 3D, 4E, 4F | No BMPs in place |

3.4 Hazardous Materials Storage

The following hazardous materials are stored at this facility in proper containment. Hazardous materials reference documents are included in Attachment D of this document.

| Table 2: Maintenance Hazardous Materials List | | | | |
|--|---|-------------------------------------|------------------------|--|
| Common Name | Chemical Name | Storage Location on Site Map | Liquid or Solid | BMPs |
| Motor Oil | Petroleum oil | 2D, 3D | Liquid | Stored inside building, large quantity on spill pallet. |
| Hydraulic Oil | Petroleum oil | 2D, 3D | Liquid | Stored inside building on spill pallet. |
| Transmission Oil | Petroleum oil | 2D, 3D | Liquid | Stored inside building, large quantity on spill pallet. |
| Grease | Grease | 2D, 3D | Solid | Stored inside building on spill pallet and in chemical storage locker. |
| Lubricant | Petroleum Oil | 2D, 3D | Liquid | Stored inside chemical storage locker/ under cover. |
| Degreaser | Monoethanolamine | 2D, 3D | Liquid | Stored inside chemical storage locker. |
| Diesel | Petroleum oil | 2D | Liquid | Stored in an underground tank. |
| Gasoline | Petroleum oil | 2D, 3D | Liquid | Stored in an underground tank/inside chemical storage locker. |
| Solvent Based Paints | Acetone, toluene, xylene, polyester resin, aliphatic polyisocyanate resin | 2D, 3D | Liquid | Stored inside chemical storage locker. |
| Purple Primer | Acetone, Methyl ethyl ketone | 2D, 3D | Liquid | Stored inside chemical storage locker. |
| Son of a gun | Mineral oil | 2D, 3D | Liquid | Stored inside building. |
| Acid magic | Muriatic Acid | 2D, 3D | Liquid | Stored inside building. |
| Home defense | Bifenthrin | 2D, 3D | Liquid | Stored inside building. |
| Floor sealer | tris(2-butoxyethyl) phosphate | 2D, 3D | Liquid | Stored inside building. |

| Table 2: Maintenance Hazardous Materials List | | | | |
|--|--|-------------------------------------|------------------------|--|
| Common Name | Chemical Name | Storage Location on Site Map | Liquid or Solid | BMPs |
| Vandalism remover | Methylene Chloride, butane | 2D, 3D | Liquid | Stored inside chemical storage locker. |
| PVC cement | Furan, Tetrahydro- | 2D, 3D | Liquid | Stored inside chemical storage locker. |
| Polyurethane | Solvent Naphtha (Petroleum) Medium Aliphatic | 2D, 3D | Liquid | Stored inside chemical storage locker. |
| Protectant | Mineral oil | 2D, 3D | Liquid | Stored inside building. |
| Bleach | Sodium hypochlorite | 2D, 3D | Liquid | Stored inside building. |
| Prep and primer | Phosphoric acid | 2D, 3D | Liquid | Stored inside chemical storage locker. |
| Brake fluid | Triethylene Glycol Monomethyl Ether | 2D, 3D | Liquid | Stored inside chemical storage locker. |
| Glass cleaner | Isopropanol | 2D, 3D | Liquid | Stored inside building. |
| Antifreeze | Ethylene Glycol | 2D, 3D | Liquid | Stored inside building. |
| Cooling system treatment | Sodium borate | 2D, 3D | Liquid | Stored inside building. |
| Bio Pro HF | d-limonene, Nonionic surfactant | 2D, 3D | Liquid | Stored inside building. |
| Starting fluid | Heptane | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Battery cleaner | Liquified petroleum gas | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Aqueous Parts Water Solution | Decamethylcyclopentasiloxane | 2D, 3D | Liquid | Stored inside building. |
| De-icer | Methanol | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Spray adhesive | Hexane | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Fuel injector cleaner | Hydrosulfurized Kerosene | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Diesel fuel additive | Butanol | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Sta-bil | isoparaffins petroleum hydrotreated HFP | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |

| Table 2: Maintenance Hazardous Materials List | | | | |
|--|---|-------------------------------------|------------------------|--|
| Common Name | Chemical Name | Storage Location on Site Map | Liquid or Solid | BMPs |
| Explosives | Explosives | 4F | Solid | Stored in explosive storage container. |
| Paint thinner | Stoddard solvent | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Roof cement | Asphalt, mineral spirits | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Enamel | Hydrotreaed Light Distillate | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Urethane Alkyd Enamel | Titanium dioxide | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Soot remover | Petroleum Distillates | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Cutting fluid | Triethanolamine | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Urethane retarder | Butyl carbitol acetate | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Stor-x | Stoddard Solvent, 2-Butoxyethanol | 2D, 3D | Liquid | Stored in a chemical storage cabinet. |
| Propane | Propane | 2D | Liquid | Stored outside. |
| Oxygen | Oxygen | 2D, 2F, 3D | Gas | Some stored inside building. |
| Acetylene | Acetylene | 2D, 3D | Gas | Stored inside building. |
| Fluorescent Lamps | Mercury | 2D, 3D | Solid | Stored inside building. |
| Razor Pro | Glyphosate | 2F | Liquid | Stored inside shed. |
| Vanquish | Diglycolamine Salt of 3, 6-dichloro-o-anisic acid | 2F | Liquid | Stored inside shed. |
| Pendulum | Pendimethalin | 2F | Liquid | Stored inside shed. |
| Base Camp | 2, 4-D | 2F | Liquid | Stored inside shed. |
| Vista XRT | fluroxypyr 1-methylheptyl ester: ((4-amino-3,5- dichloro-6-fluoro-2-pyridinyl)oxy)acetic acid, 1-methylheptyl ester | 2F | Liquid | Stored inside shed. |
| Ranger pro | Isopropylamine salt of glyphosate | 2F | Liquid | Stored under cover. |
| Super spreader | Methyl Soyate, Nonylphenol ethoxylate blend | 2F | Liquid | Stored under cover. |

3.5 BMP Training and Awareness

Per the UDOT SWMP, UDOT policy and practice is to provide education and training to ensure employees have the knowledge and skills necessary to perform their functions effectively and efficiently. Annual stormwater training is required of all UDOT employees whose duties involve stormwater management and administered through the UDOT Learning Portal. The Pollution Prevention and Good Housekeeping training includes the following topics:

- equipment inspection to ensure timely maintenance;
- proper storage of industrial materials (emphasize pollution prevention);
- proper management and disposal of wastes; proper management of dumpsters;
- minimization of use of salt and other deicing materials (cover/prevent runoff to MS4 and ground water contamination);
- benefits of appropriate on-site infiltration (areas with low exposure to industrial materials such as roofs or employee parking);
- proper maintenance of parking lot surfaces (sweeping).

Station Supervisors will review BMPs with crews to prevent or control non-stormwater discharges every time there is a change of type of work activity. BMP training sign in sheets for this facility are included in Attachment E of this document.

The Station Supervisor is responsible for providing and documenting on-going awareness training for stormwater pollution issues for activity crews and station personnel. Training is conducted during tailgate and pre-job meetings to review environmental concerns and BMPs, and to ensure that BMPs are implemented during maintenance activities. The awareness training includes:

- The importance of observing good housekeeping practices, with emphasis on preventing debris from entering the Station's stormwater management system.
- Explanation and discussion of required standards for housekeeping and the procedures required to maintain those housekeeping standards.
- Explanation and discussion of spill response procedures, locations and proper usage of absorbent materials and spill recovery equipment, spill response methods, disposal of spill cleanup materials, and spill reporting requirements.
- Discussion of material management practices and UDOT policies associated with the outdoor storage of materials and the practices for handling materials to minimize the potential for discharges.
- Discussion of proper solid waste handling procedures.

4 NON-STORMWATER DISCHARGES

The UDOT MS4 Permit prohibits the release of non-stormwater discharges into the MS4. Unlike with the sanitary sewer, the stormwater system leads directly into Waters of the State (streams, rivers, lakes, groundwater, etc.) without going through a water treatment system. Anything that enters the storm system will end up in Utah's water. Diligence is required at all UDOT facilities to eliminate non-stormwater discharges to Utah's waters.

4.1 Spills and Discharges (Prevention and Reporting)

The Department's UDOT MS4 Permit prohibits the discharge of non-permitted non-stormwater discharges. If a discharge occurs, or if the station receives a written notice or order from any regulatory agency, the Station Supervisor will immediately notify the Region Stormwater Program Coordinator. The Station Supervisor will coordinate the reporting of prohibited non-stormwater discharges to the DWQ through the Region Stormwater Program Coordinator and the Area Supervisor.

To prevent non-stormwater discharges from occurring, the responsible Station Supervisor will ensure that maintenance personnel:

- Determine where the flow of a leak, spill, or other runoff will travel;
- Identify drain inlets and water courses, both upstream and downstream of the work site;
- Ensure that vehicles and equipment are clean and in good operating condition by conducting pre-operational inspection of vehicles and equipment;
- Set up work areas to minimize the tracking of material by vehicles and equipment in and out of the work area;
- Collect and properly dispose of wastes, materials removed as a result of equipment and system maintenance, litter and debris;
- Secure lids on containers of liquids when not in use;
- Control spills promptly;
- Have appropriate spill cleanup material onsite and protect drainage systems and watercourses from spilled material.

5 FACILITY SWPPP INSPECTIONS

As stated in the UDOT MS4 Permit, UDOT is required to conduct weekly, or more frequent as necessary visual inspections of UDOT facilities and track those inspections in a log for every facility. The purpose of the inspections is (1) to identify areas contributing to a discharge of potential pollutants associated with the maintenance station activities, and (2) to evaluate whether BMPs identified in the SWPPP are adequate and properly implemented or whether additional control practices are needed.

Station Supervisors are responsible for weekly visual inspections, quarterly comprehensive inspections (with specific attention paid to waste storage areas, dumpsters, vehicle and equipment maintenance/fueling areas, material handling areas, salt storage and brine making areas and similar pollutant-generating areas) and quarterly visual observation of stormwater discharges. Inspections are to monitor the implementation and adequacy of the facility's BMPs and for notifying the Area Supervisor and Region Stormwater Program Coordinator in the event that a non-stormwater discharge or other instance of non-compliance occurs.

All Weekly Visual Log, Quarterly Comprehensive, and Quarterly Discharge inspections shall be completed using the Survey123 app or through a web browser on the desktop at the following link:

<https://uplan.maps.arcgis.com/apps/MapSeries/index.html?appid=a647f52268964e7aa890332b6b544be6>

Records of completed inspections and inspection form responses can also be accessed at the above link.

Stormwater self-audit inspections conducted by UDOT personnel, or inspection documents from local regulatory agencies, will be appended to Attachment F of this SWPPP, and retained for at least the effective period of the permit.

Appendix C includes an SOP for utilizing Survey123 as well as a list of information recorded in each of the electronic inspection forms.

Weekly Inspection Forms

- UDOT Maintenance Station Weekly Inspection Log – This visual inspection is to be completed at least weekly and whenever a spill is detected at the maintenance station. Weekly inspections are documented in the Weekly Visual Inspection Survey123 form. Details of the information collected through this inspection form are on page C-8. Any spill events (whether observed during the weekly visual inspection or otherwise) must be documented with the same Weekly Visual Inspection Survey123 form.

Quarterly Inspection Forms

- UDOT Maintenance Station Quarterly Comprehensive Stormwater Inspection – Details on the information collected in the electronic Survey123 form are on pages C-3 to C-7.
- UDOT Maintenance Station Quarterly Stormwater Discharge Inspection – Details on the information collected in the electronic Survey123 form are on page C-2.

Station supervisors are responsible for addressing deficiencies noted on any inspections and documenting the corrective actions.

ATTACHMENT B:
Operations and Maintenance Program
(Standard Operating Procedures & Resources)

Resources for Standard Operating Procedures

Below are some additional resources and information about the Standard Operating Procedures that are conducted at this facility.

Inventory Control:

Region and Central warehouses have eliminated chlorinated solvents from inventories and now stock citrus-based solvents. Good BMPs for inventory control:

Inventory Management

- Buy only what is needed over a 3-month period
- Rotate inventory so older material is used first
- Store materials in a manner to prevent spills, leaks, or damage to containers
- Use secondary containment where prudent
- Use an inventory tracking system
- Label all containers with contents, date of purchase, date opened
- Don't accept free samples you won't use
- Be licensed to use restricted chemicals
- Read and become familiar with labels
- Use environmentally safe chemicals
- Keep absorbent materials readily accessible; renew supply to handle a 55-gallon drum rupture.

Waste Management:

All hazardous wastes are defined by characteristics that are harmful to human health and the environment. A chemical product (including liquids, gases, solids, powders, etc.) becomes a waste when it is released from its original container in an uncontrolled manner. Proper waste management must include knowledge of each product's and/or waste material's properties. This aids in determining proper handling and disposal. Properties that are "characteristic" and define hazardous waste are listed in the box below.

Characteristic Wastes*

- Ignitable
- Corrosive
- Reactive
- Toxic

**40 CFR, Part §261.20-261.24*

Characteristic wastes are regulated by federal, state, and local laws and codes. These waste characteristics are carefully defined in the Code of Federal Regulations, (CFR) Title 40, and Part 260. Review of regulations covering a particular waste stream is necessary to determine how to properly manage, transport, and safely dispose of it. Careful handling and multi-copy paperwork that tracks waste generation to final disposal (“cradle to grave”) is required.

Waste Segregation:

Characteristic wastes should be stored and segregated according to their properties. Some wastes can be incompatible, causing chemical reactions that can lead to toxic gas production and/or spontaneous ignition. Product Material Safety Data Sheets aid in determining proper handling and disposal. Keep waste containers tightly closed and stored in a well-ventilated area. Storage times do not exceed UDOT’s Small Quantity Generator status of 180 days. Likewise, quantity stored should not exceed 2200 pounds per month (approximately 4 drums). Arrangements are made for disposal with a State contracted hazardous waste disposal company to have the wastes removed.

Spill Response & Emergency Preparedness

First response agencies shall be called when UDOT employees and/or its agents observe **any hazardous material/s release to water bodies, 1 gallon or more of hazardous chemical/s, 25 gallons of hydrocarbons (fuel, oil) or more are released to the environment** (see Attachment D for US D.O.T. Hazardous Materials definition and classifications). Call down lists are posted at maintenance stations and provide the Department of Environmental Quality’s (DEQ’s) 24-hour emergency response number.

Maintenance Emergency Call Down List

| Immediately Contact | |
|--|---------------------|
| Dispatch | 911 |
| Station Supervisor | 435-691-0089 |
| Area Supervisor | 435-459-1202 |
| Region Stormwater Program Coordinator | 435-893-4741 |
| 24 Hour Emergency Phone Number for Incident Spills | 801-536-4123 |
| Within ½-hour contact | |
| District or Maintenance Engineer | 435-896-0729 |
| Local Health Department | 435-637-3671 |
| Region Safety/Risk Manager | 435-896-1315 |
| Hazardous Waste Spills | 801-538-6170 |
| Large Spills And/or Water Affected | |
| Releases Affecting "Waters of the State" or involving Petroleum Products | 801-538-6146 |
| National Response Center | 800-424-8802 |

Report spills immediately. Begin cleanup ASAP.

Obtain help from experts!

| Maintenance Stations - Good Housekeeping Checklist | |
|--|--|
| Used Oil & Fuels | |
| Drum oily rags for an industrial cleaner to process and recycle. Do not add liquids to drum. Keep drum lid closed when not in use. | |
| Collect used oil in maintenance station's used oil tank or collect in drums stored within lined and bermed secondary containment at construction staging areas. | |
| Pierce used oil filters and allow to drain for a minimum of 24 hours. Wrap empty filters in newspaper and dispose in dumpster. | |
| Label as "Used Oil" tanks or drums and secure with padlocks to deter illegal dumping. Used crankcase oil is recyclable and therefore considered non-hazardous. Utah has many certified oil recyclers. The Division of Solid and Hazardous Waste in DEQ has a variety of resources listed on their website: http://www.deq.utah.gov/ProgramsServices/programs/waste/usedoil/#facilities https://deq.utah.gov/waste-management-and-radiation-control/used-oil-recycling-program | |
| Solvents, Chemicals, Herbicides | |
| Eliminate chlorinated solvent usage. These solvents generate hazardous waste, are toxic to environment and carcinogenic to humans. Use citrus-based solvents in their place. Secure tight fitting lids on volatile substances to prevent evaporation and spills. | |
| Use contained and self-draining parts washers. If warranted, consider a solvent recycling/regeneration parts washer. No hazardous waste is generated. | |
| Do not aerate solvents, thinners, or fuels as a disposal method. This is an air quality regulation violation and is subject to fines. | |
| No open containers in and around work site. Use spigots and hand pumps on drums and 5-gallon containers. When mixing chemicals such as herbicides, pour concentrate slowly to avoid "glug and splash" from vacuum created in container. | |
| Vehicle Maintenance | |
| Regularly inspect and maintain station equipment. Repair seals and leaks as practicable and use absorbent materials where necessary. | |
| Never hose hazardous materials down drains or off pavement. Avoid spreading hazardous waste to the environment. | |
| Use drip pans and/or absorbent pads under work that can release fuels, oils, solvents, and chemicals that will produce characteristic wastes. | |
| Security | |
| Secure maintenance stations and construction staging areas with locked gates when unoccupied. | |
| Use and maintain a supply of personal protective equipment appropriate to work (i.e. gloves, protective eyewear, coveralls, etc). | |
| Keep a supply of absorbent materials/spill prevention kit at hand for accidental spills. Learn proper disposal methods from MSDS. | |

Dumpster Maintenance SOP

Purpose

- This SOP is designed to mitigate discharges of pollutants from waste receptacles and dumpsters.

Pollutants and BMPs

- Pollutants associated with dumpsters: litter, debris, petroleum products, sediments, total suspended solids, and chlorides
- List of BMPs in place: dumpster with a lid, concrete pad

Site Considerations

- Do not overfill dumpsters and waste receptacles.
 - Separate landfill waste from other recyclable waste to save space in dumpsters.
 - Keep enough dumpsters onsite to contain the volume of waste that is generated at or brought to the facility.
- All dumpsters must have lids, and any dumpsters with drain openings in them are required to have plugs.
 - Lids must be undamaged and be able to cover the opening of the dumpsters.
 - Lids must be on dumpsters and closed while not in use.
 - Plugs for dumpster drains must be inserted and seal the drain while the dumpster is not being emptied. Only drain dumpsters so that the waste water enters a BMP, such as an oil/water separator, before the sanitary sewer or other containment to be disposed of.
- Dumpsters must be clearly identified and accessible onsite.
 - Any bins that are dedicated to recycling materials must be labeled as such.
- This facility has 3 dumpsters onsite
 - They can be found at the following locations: along the north fence of the property
 - The site also contains the following dedicated recycling containers: none

Inspection

- While performing the weekly and quarterly facility inspections, inspect all dumpsters and recycling containers onsite.
 - Look at the condition of the dumpsters. If there are holes, warping, punctures, or other defects, replace the container.
 - Look at the area surrounding dumpsters. If there is trash, debris, staining, or other waste around the dumpster areas, clean the affected area. It may be necessary to train staff on proper waste disposal procedures.
 - Inspect the lids of the dumpsters. If they are damaged or missing, replace them. If the lids are not covering the dumpster, close the lids.
 - Inspect dumpsters for drain plugs. If the plugs are damaged or missing, replace the plugs.
 - Are the dumpsters and recycling containers labeled? If not, label them.

Documentation

- All dumpsters and recycling containers must be identified on the site map of the facility Stormwater Pollution Prevention Plan (SWPPP)
- Keep documentation of all training in the SWPPP; utilize the training records sheet located in Attachment E: Training Information.

Material Handling and Storage SOP

Purpose

- This Standard Operating Procedure (SOP) will lay out procedures to minimize stormwater contact with materials that are brought to, used, and stored in UDOT facilities.
- Since different facilities have different functions, tools, and materials stored onsite, the procedures in this SOP are concerned with general Best Management Practices (BMPs) to prevent pollutant discharges.

Pollutants and BMPs

- Pollutants associated with material handling and storage: petroleum products, chlorides, heavy metals, pesticides
- List of BMPs in place: temperature controlled storage, covered storage, cabinets for containment

Site Considerations

- If site conditions allow, keep all materials stored under cover, or inside of a building.
 - If this is not feasible, store materials off the ground and under temporary forms of cover.
 - This can be accomplished by placing materials on pallets to store them, and keeping them shrink wrapped until used, or by providing a tarp or other cover.
 - Provide perimeter control around areas that are exposed to runoff or sheet flow.
 - Berms, dikes, or other elevated platforms for storage will prevent sheet flow from coming into contact with stored materials.
- In locations where equipment is loaded to and from the storage area, keep an emergency spill kit in place in case of drips, spills, or other fluid discharges from vehicles.
- Keep all stored materials away from channelized stormwater conveyances and storm drain inlets.
- Keep the storage area clean, with proactive sweeping or cleaning routines to prevent the buildup of trash and debris.
- After unloading and storing materials, dispose of all packaging, transportation waste, containers, or other materials which could come in contact with stormwater and be transported to the storm drain system.
- Minimize the amount of materials stored onsite.
 - Consider surplussing old stock.
 - Consider limiting amounts of items or material until sufficient space is available to store more materials, or until the current supply is exhausted.
- This facility stores materials and supplies in the following locations
 - The main building of the station.
 - The following materials have special storage needs: scrap iron and aluminum.
 - Those storage requirements include: an area onsite to hold the scrap metal until there is enough to haul away.

Inspection

- During the facility stormwater inspections, inspect all material storage areas.
- Are materials stored inside?

- Is there litter and debris in the storage area that could be carried or tracked outside and come into contact with stormwater? If so, clean the affected area and properly dispose of any waste.
- Is there a spill kit, or other containment measure to assist with the cleanup of any spills or leaks that occur in the delivery and loading process? If not, or if the kit has insufficient materials, replace the spill kit.
- Are materials stored outside?
 - If so, are materials covered and kept off the ground? Any materials that could come in contact with stormwater should be placed on pallets, or otherwise kept out of contact with stormwater.
 - Are the materials stored in an area that can come into contact with stormwater? Are there perimeter controls in place to prevent contact with stormwater? If the area has a tendency to flood, receive runoff, or is in the path of a channelized conveyance, consider moving the storage area to an area where those risks are minimized.
 - Does the type of material stored pose a threat to runoff? Inert materials that do not pose a risk to stormwater, and cannot be carried by runoff do not need the same level of BMP attention as materials that do.
 - For example, it is more important to store bags of dry mix cement off the ground and keep them under cover than it would be to keep PVC pipe off the ground and covered.
 - Is the area around the stored material free of debris, waste or other potential pollutants? Clean all affected areas and properly dispose of the waste.

Documentation

- All storage areas should be identified on the site map located in the facility Stormwater Pollution Prevention Plan (SWPPP).
 - If the site handles and stores hazardous materials in these areas, or has potential pollutants that are not inert materials stored there, identify what those materials are on the map.
 - If the site changes the location or type of materials stored onsite, update the map to reflect those changes.

Salt Storage SOP

Purpose

- The purpose of this Standard Operating Procedure is to assist maintenance staff in reducing salt and deicing agent pollution from entering the stormwater system at UDOT facilities.

Pollutants and BMPs

- Pollutants associated with salt storage: salt, chlorides, sediments, total suspended solids, heavy metals, nutrients
- List of BMPs in place: salt shed, retention basin, sweeping,

Site Considerations

- All UDOT facilities must store road salt and deicing agents under a covering. All UDOT facilities that store salt and deicing agents onsite must have constructed sheds.
 - Only salt and/or grit should be stored in salt storage buildings.
 - Salt and deicing agents must be stored completely within their covered storage area except when adding or removing material from the piles. Avoid overfilling salt sheds.
 - Keep piles well groomed, and free from contact with other materials.
- Any salt piles that are stored outside must be covered.
 - The Utah Division of Water Quality (DWQ) may allow exceptions to this rule for areas where residual salt levels are high enough that salt runoff does not cause an additional threat. If this is the case, document all communications and agreements with DWQ and keep those records in the facility Stormwater Pollution Prevention Plan (SWPPP). Verify this information with the Station Supervisor or Region Stormwater Program Coordinator: Von Bowerman (435) 691-0089 & Jared Barton (435) 893-4741
- Loading sanding trucks is a source of spills and track-out from salt storage areas. Proactive housekeeping of these areas will substantially reduce salt discharges from the facility.
 - This facility loads salt into the sanders at the Thompson salt shed and at the Westwater salt shed.
 - While loading, refrain from overfilling the loader bucket or shake off any excess salt at the salt pile to prevent spills.
 - Reduce the speed of loading for salt and deicing agents into trucks to decrease spills. When leaving the station with loaded sanders, prevent spills by making slow turning movements within the yard and when exiting onto a public streets.
 - Do not overfill trucks while loading them for operation.
 - When loading activities are finished, sweep any excess salt back into the storage sheds, and/or dispose of any salt or deicing agent that has been contaminated by contact with other materials.
 - After loading salt into or out of the covered storage area, ensure that salt tracked out of the storage area is pushed back into the storage shed.
- Salt and deicing piles must be stored on impervious surfaces, if feasible.

Inspection

- During the Weekly and Quarterly Comprehensive Inspections, inspect salt storage areas and the surrounding loading areas.
 - Look for any salt or deicing materials that have been spilled or tracked out of the storage area. Sweep any clean salt back into the shed to ensure that the salt pile in the shed has no possibility of contact with precipitation.
- Look at the surrounding area where salt is loaded into the sanding trucks. Is salt staining or runoff from the loading area present?
 - Clean the affected areas using dry methods such as sweeping. Return any salt or deicing agents that are uncontaminated to the storage area.

Documentation

- All salt storage sheds must be identified on the site map of the facility SWPPP.
 - If the facility has a dedicated loading area or a structure to load salt trucks, identify it on the site map.

Keep records on the Training Information log in Attachment E of the SWPPP for all staff members who have been trained on the proper handling of salt and deicing materials.

Solid Waste Management SOP

Purpose

- The purpose of this SOP is to prescribe methods to reduce and eliminate pollutant discharges generated through the storage or removal of solid wastes at UDOT facilities.
- The day-to-day maintenance of a UDOT facility as well as routine operations through the operating area of a facility can generate a large amount of solid waste, all of which need to be addressed as a part of UDOT pollutant generating operations.

Pollutants and BMPs

- Pollutants associated with solid waste management: heavy metals, petroleum products, litter, debris, nutrients, solvents,
- List of BMPs in place: retention pond, dumpster with lid and plug, containment area for waste, waste containers with sealed or secure lids, decant area

Applications and Considerations

- A maintenance station may store the following types of debris:
 - Maintenance waste such as construction debris, non-hazardous equipment waste, grindings, wood scrap, packaging and transport materials, asphalt, concrete, and similar materials.
 - Sediment, plant debris, grass clippings, or other material from right of way maintenance.
 - Litter, including plastic, paper, and other debris generated by the staff onsite, as well as cleaning activities in the right of way.
 - Any other wastes generated from the specific functions of the maintenance facility, such as none
- For each type of waste, it is important to designate containers for the waste or areas of the maintenance facility for stockpiling waste:
 - Do not place containers or designate waste areas in locations on the site that are prone to flooding, or contact with stormwater if feasible.
 - Obtain sufficient disposal containers to store the volume of waste present at the site at any given time.
 - If material is stockpiled before disposal and not kept in containers, appropriate Best Management Practices (BMPs) should be utilized where feasible.
 - Whenever feasible, store waste under existing cover, as it will decrease the exposure of the waste to stormwater and/or pooling of water in containers.
- For all waste stored onsite, BMPs must be in place to prevent the discharge of pollutants from the site:
 - All bins and containers should be covered with lids, unless adding or removing waste.
 - All dumpsters must have lids that fully cover the opening, and plugs for all units with drain openings.
 - For all large roll-off dumpsters, it is not necessary to cover them at all times if the waste is contained within the bin. For example, if trash is bagged, and the

bin is not overfilled, it is not necessary to cover the bin. But if material is blown out of the dumpster, it is not contained.

- Stockpiles should have perimeter control and covers while not in use. Depending on the type of stockpiled waste, it may be necessary to keep it covered at all times. If stockpiles are only kept for short periods of time, continuous cover may not be needed.
- The maintenance facility must have a plan to properly dispose of all waste from their facility. This should include securing contract services or assigning personnel who are responsible to transport waste to an appropriate waste receiving facility.
 - This facility accepts the following waste that requires special disposal requirements:
 - N/A
 - This facility currently send waste to Monument Waste, located at 2295 S highway 191 Moab, UT or Price City Sanitation, located at 780 S. 800 E. Price, UT to properly dispose of the waste.

Inspections and Maintenance

- During the Quarterly Comprehensive Inspection, inspect each designated waste container, as well as any stockpiles and storage areas.
- While inspecting those areas, look for any defects in the waste containers such as holes, punctures, or other problems.
 - Look for staining, rusting, or other discoloration from the containers in the area around the container. If there are such markings, investigate the area to look for any sources of liquid run-on into the area. Rusted or defective containers can leak and discharge pollutants into the storm drain system if not addressed.
- Look for any debris, trash, or spillage from the containers or waste storage areas. The presence of materials around the containers instead of in them may indicate that they have been overfilled, that personnel have accidentally spilled waste while putting it into the container, or that the wind may have blown some of it from the container.
- Check to ensure all lids, covers, tarps, or other BMPs are in place. Check all dumpsters to make sure the lids are closed, and any drain ports are properly plugged.
- If any container is defective and discharging waste, repair or replace it immediately. For stockpiles discharging waste, immediately put in place additional BMPs.
- Any debris or waste that is not in its proper waste container should be placed in its container immediately.
- Periodically review any waste removal agreements in place with third parties, to ensure that the type and volume of waste stored onsite is removed in a timely manner, to reduce the risk of discharging pollutants at the facility.

Documentation

- If, during the course of weekly visual or quarterly comprehensive inspection, a deficiency is discovered, the problem must be immediately addressed, and recorded in the inspection form along with the corrective action that was taken.

- If there is a waste or hazardous material discharge that occurs during the course of work, it must be immediately cleaned up and the corrective actions recorded in the inspection form.
- Identify any location where waste is stored on the site map located in the SWPPP.
 - If the locations or types of stored waste change on the site, the SWPPP must be updated to reflect those changes.

Detention and Retention Basin SOP

Purpose

- This Standard Operating Procedure (SOP) is intended to help maintain detention and retention basins found on UDOT maintenance shed properties.

Pollutants and BMPs

- Pollutants associated with activities involving detention and retention basins: petroleum products, sediments, total suspended solids, litter, debris, heavy metals, nutrients, chlorides, salt.
- List of BMPs in place: retention basin, detention basin, decant pad, berms, pumping and proper disposal of pond waste

Site Considerations & Procedures

- The flow of stormwater runoff should be known in order to see what inlets receive or where the stormwater flows into the detention or retention basin.
 - This facility has these inlets that receive stormwater flows: none
 - This facility has a detention basin located: none
 - This facility has a retention basin located: northeast corner of the site.
 - This facility's retention basin is this type of basin: asphalt and clay
- Look at the depth of the basin. If it is close to overflowing, identify any inlets the overflow would flow to, install inlet protection, and block inlets.
- If the basin overflows, create a berm using sandbags to contain the flow.
- Contact pumping contractor to pump out pond and inform Region Stormwater Coordinator
- When cleaning out the basin, provide outlet protection to minimize the debris that might leave the basin during cleaning.
- Clean the basin of sediment by using a backhoe or front-end loader from the bottom if basin is lined with zero-void asphalt or concrete. Otherwise, use a vactor truck to clean the basin if it is plastic-lined.
 - This facility has a clay and asphalt lined basin that is maintained by vactor or sweeper.
- Clean the concrete pads when finished using dry methods like sweeping and shoveling.
- Properly dispose of sediment and waste in properly contained areas on site. Decant waste at the decant pad onsite located: N/A Dispose off-site at Clean Harbors Environmental Service Inc.

Inspections

- During the weekly visual and quarterly comprehensive inspection, inspect all areas of the detention and or retention basin.
 - Look for any trash or blockages near any of the inlet and outflow structures.
 - If there are any blockages or trash, remove and dispose of trash and debris.
 - Inspect the height of the vegetation if applicable. Schedule mowing if necessary.

- Inspect the basin for any buildup of sediment. Schedule removal sediment if needed.
- Inspect the riprap around the outlet to determine if it is providing sufficient outlet protection. If not, notify the engineer for further inspection.
- Inspect the forebay and any pretreatment diversion structures for any sediment build-up. If so, remove and dispose of the sediment.
- Inspect any head gates in the basins to ensure they are function and do not require maintenance.
- Inspect the leak detection mechanism (if present) for any water leaking from the pond. If there is a leak, notify the Region Stormwater Coordinator for further inspection.
- If the basin has a liner, inspect the liner to make sure it is functional and sufficient. If damaged or found inoperable, notify Region Stormwater Coordinator for further inspection.

Documentation

- All detention and retention basins should be identified on the site map and located in the facility Stormwater Pollution Prevention Plan (SWPPP).
 - If the site makes any changes to the detention and or retention basin, update the map to reflect those changes.

Used Oil, Solvent and Cleaner SOP

Purpose

- This Standard Operating Procedure (SOP) is intended to reduce and eliminate spills and discharges of used oil, solvents and cleaners at UDOT facilities.

Pollutants and BMPs

- Pollutants associated with used oil, solvents and cleaners: petroleum products, solvents, degreasers, chlorides, pesticides, nutrients, heavy metals, sediments, total suspended solids
- List of BMPs in place: used oil tank, concrete containment bin, metal cabinets, indoor storage, oil containers with secure or sealed lids, spill kit

Site Considerations

- All used oil must be stored in secure containers that must have secondary containment.
- Make sure all used oil is properly disposed of in a used oil tank that has the proper containment liners. The tank should also be in its own containment bay that is closed off and doesn't allow for leaks.
 - This facility has a used oil storage tank located on the east side of maintenance shop
 - This facility has used oil containers located inside the maintenance shop.
- Ensure all used oil storage from all truck maintenance is stored in a covered location.
- If used oil containers are stored outside, they must be under a covered area away from storm drains, with secondary containment measures in place.
- When transferring any oil, make sure it's done over an impervious surface or that a tarp be placed on the ground to catch any spills.
- Clean any used oil spills as soon as possible using dry methods.
- Store all cleaners and solvents indoors with secondary containment methods.
 - This facility storage of cleaners and solvents are located in a cabinet, inside the maintenance building.
- Treat all solvent and cleaner waste as hazardous waste and dispose of waste in the facility hazardous waste area or transfer to another facility for proper disposal.
 - This facility has a hazardous waste storage area located: N/A
 - This facility sends hazardous waste to N/A

Inspections

- During the weekly and quarterly inspections, inspect all used oil, solvent and cleaner storage areas and containers
- Inspect the containment area of the used oil.
 - Is there any evidence of oil leaks outside of the containment bay? If so, clean the spill using dry methods and report the faulty containment bay to the supervisor for repairs.
 - Make sure a spill kit is nearby and that the spill kit is sufficient. If not, replace the spill kit.

- Inspect the oil containers
 - Is the lid to the container shut properly and air tight? If not, replace the oil container.
 - Check the container for signs of leaks or rust. If there are leaks and rust, replace the container.
- Inspect the storage area where the cleaners and solvents are stored.
 - Is there any evidence of leaks or spills? If so, clean the spill as soon as possible and inspect the containment area. Replace the containers if damaged or not sealed properly.
 - Check the secondary containment area. Is there any evidence of leaks? If so, replace or repair the secondary containment measure.

Documentation

- All used oil and storage areas should be identified on the site map located in the facility Stormwater Pollution Prevention Plan (SWPPP).
 - If the site changes the location of the used oil or storage of the solvents or cleaners, the site map must be updated to reflect those changes.

Spill Prevention and Response SOP

Purpose

- This SOP will outline procedures and concerns to reduce and potentially eliminate discharges from maintenance operations and material storage at UDOT facilities.
- For hazardous materials, or materials that have specific disposal requirements, follow any manufacturer's guidelines or specifications to contain and clean up spills.

Pollutants and BMPs

- Pollutants associated with spill prevention and control activities: petroleum products, solvents, pesticides, sediments, total suspended solids, litter, debris, heavy metals, nutrients, chlorides
- List of treatment BMPs in place: oil/water separator, spill kit, berms, secondary containment, master switch for vault electric pump, inline slide gates

Spill Response Procedures

- If a spill occurs, utilize an appropriate spill kit to contain the material as soon as the spill occurs.
 - If the volume of the spill causes runoff, cover or dam any storm drain inlets that could receive flows from the spill. Do not allow the spill to enter the storm drain system.
 - If feasible, repair or remove the cause of the spill before cleaning the spilled material.
- Do not use hoses or other equipment to wash or spray down the spilled material. Washing material into a storm drain system, or into a Water of the State, is a violation of the UDOT MS4 permit. Washing certain material into the sanitary sewer system may not be allowed. Contact local sanitary sewer district manager or local government engineer for guidance.
 - This facility has sanitary sewer connections located none onsite.
 - The preferred cleanup method is always to use dry methods to clean the spill.
- When using absorbent materials to clean a spill, allow time to let the material be completely absorbed. Remove all the material and properly dispose of it afterwards.
 - Do not let the absorbed material stay in place for longer than necessary, or let it contact stormwater, or other runoff. If contaminated absorbent material enters the storm drain system, it is a violation of the UDOT MS4 permit.
- If pollutants enter the storm drain system or the sanitary sewer system, it may be necessary to report the spilled material to the Division of Water Quality (DWQ), the Area Supervisor, Region Stormwater Program Coordinator, or the local entity in charge of the sanitary sewer system. **You must immediately contact DWQ for any spill that violates sanitary sewer pretreatment standards or a slug discharge.** For purposes of this subsection, a Slug Discharge is any Discharge of a non-routine, episodic nature, including but not limited to an accidental spill or a non-customary batch Discharge, which has a reasonable potential to cause Interference or Pass Through, or in any other way violate the POTW's regulations, local limits or Permit conditions. These notifications cannot be made to voicemail.
Additionally, written notification must be made to DWQ within 5-days.
 - This facility must report any spills of and fuel, oil and chemicals.

Site Considerations

- The site should designate areas to store liquids, wastes, and other materials that have a potential to cause spills, discharges, or leaks that are designed to reduce or eliminate contact with the stormwater or sanitary sewer system, and prevent runoff.
 - Storage areas should have cover.
 - Secondary containment, berms, or other barriers to prevent runoff are good ways to reduce the risk of discharge.
 - Any wastes or liquids that are stored inside must be in secondary containment to prevent any spills to the sanitary sewer system. All containers must be labeled correctly.
- Each storage area, fueling station, or other area where potential spills, leaks or discharges may occur must include a spill kit.
 - Spill kits should be tailored to clean the types of pollutants that are present in the area.
 - For example, around fueling areas all spill kits should have hydrocarbon absorbent materials.

Inspections

- During the weekly visual and quarterly comprehensive inspections, inspect all areas where materials or operations with a potential for spills, leaks, or discharges are onsite.
 - Look for any signs of spills, leaks, or other material.
 - Clean all leaks and spills immediately.
 - Remove or repair any sources of pollutants, which are causing or could cause a discharge.
 - Look for any leaks in secondary containment measures near any sanitary sewer drains and connections. Clean any leaks and spills. Note any deficiencies to the Region Stormwater Program Coordinator or the Area Supervisor.
 - Look at the spill kits.
 - Do the spill kits have the appropriate material to address the potential pollutant sources that are present where they are stored?
 - Are the spill kits full? Replace or refill any kits that are empty or partially empty.

Sweeping and Vacuuming Operations SOP

Purpose

- Sweeping and vacuuming waste materials from the right of way is an effective means to reduce pollutants present on the right of way which can originate from the public or UDOT operations such as de-icing.
- Sweeping and vacuuming waste often contains contaminated stormwater that has commingled with contaminate wastes. It is important to note that the liquid waste is as important to contain as the solid waste from sweeping and vacuuming.

Pollutants and BMPs

- Pollutants associated with sweeping and vacuuming operations: sediments, total suspended solids, litter, debris, heavy metals, nutrients, chlorides, solvents, degreasers, petroleum products
- List of BMPs in place: concrete containment bin, indoor garage storage for vehicle and equipment

Operations and Waste Storage Considerations

- Whenever possible, sweeping and vacuuming waste should be transported to an approved facility that accepts it, instead of bringing it back to the maintenance facility. If the waste can be taken immediately to a receiving facility, it will prevent the need to set up other BMPs at the UDOT facility to contain the solid and liquid waste.
 - Facilities that choose to bring vacuuming and sweeping waste back to the facility must have the appropriate means to store the waste, and a plan to dispose of it properly.
 - Decanting wastewater into a retention pond is acceptable only if the facility does not use the receiving retention pond as makeup water for brine making operations.
 - If the site has a dedicated facility that was constructed for the sole purpose of storing or decanting vacuum and sweeping waste, the facility Stormwater Pollution Prevention Plan (SWPPP) should identify that facility on its site map.
 - None onsite
- Waste storage must be in an area where there is minimal to no exposure to stormwater, and where there is no risk of having runoff enter the storm drain system.
 - Berms can be used to prevent run-on to the storage area. Those berms must be watertight, and cannot allow any liquid that may be present in the waste to runoff from the area and create a discharge from the site.
 - Jersey barriers are insufficient to contain the waste storage.
 - If waste is stored on an impermeable surface such as asphalt, make sure there are no cracks, holes, defects, or other issues where it is stored. Discharges of pollutants to groundwater is a violation of the UDOT MS4 permit.
 - The following areas onsite can store waste from vacuuming and sweeping:
 - None onsite

- UDOT maintenance facilities are also responsible for preventing salt, sediment, or other pollutant track out from the facility onto the right of way.
 - If feasible, use dry methods such as hand brooms to clean any tracking off the site.
- Sweeping and vacator vehicles are stored at the following locations onsite
 - The power broom is located onsite, in the vehicle storage area.
- Regularly clean and maintain all vehicles or equipment used in sweeping and vacuuming operations after use.
 - All maintenance and cleaning should be done in the appropriate areas of the facility to capture washwater runoff or any potential leaks or spills.
 - If vehicles leak or drip fluids, provide drip pans or other BMPs to contain any potential pollutants from leaving the area.

Inspection

- During Weekly Visual and Quarterly Comprehensive Inspections, inspect all areas of the site where vacuum and sweeping equipment and/or waste is stored.
- While inspecting waste storage areas onsite, look for the following:
 - Is the waste storage area separated from stormwater run-on and runoff? If there is potential contact between stormwater run-on and the waste storage area, additional BMPs may be needed.
 - Are the berms or other perimeter BMPs in good condition? Repair or replace any perimeter controls that are defective.
 - Is there evidence of the waste decanting to an inappropriate location such as a storm sewer connection? If runoff from the waste pile is not draining to the appropriate place such as the retention pond, it may be necessary to move the waste pile, or change the site conditions to ensure runoff reaches the appropriate destination.
 - Have winds or other conditions caused debris from the waste pile to erode and pose a risk to stormwater? If precipitation, wind, or other weather conditions are anticipated, or have caused erosion of the waste pile to occur, utilize cover or other BMPs to prevent contact and reduce erosion.
 - Leaving the waste pile exposed for long periods of time will increase the risk of erosion. Decreasing the amount of time the pile is left to decant will decrease the risk of creating pollutant runoff.
- While inspecting vehicle and equipment storage areas, look for the following:
 - Are the vehicles stored in such a way to minimize contact with stormwater?
 - Is there evidence of leaks, spills, or other drips from the vehicles?
 - Is there any evidence of damaged vehicle parts that may cause a leak while the vehicle is in operation?
 - Are there drip pans and an emergency spill response kit in the storage area?

Vehicle and Equipment Fueling SOP

Purpose

- This SOP is designed to identify methods to reduce and eliminate pollutants associated with fueling vehicles and equipment at UDOT facilities.

Pollutants and BMPs

- Pollutants associated with vehicle and equipment fueling: petroleum products, litter, debris,
- List of BMPs in place: spill kit, automatic shut off valves on fuel pumps,

Site Considerations

- Facilities that have state fueling islands incorporated into their sites have a different set of Best Management Practices (BMPs) to eliminate pollutant discharges than other fueling operations do.
 - This facility has a fuel island/ fueling area located in the northwest area of the Thompson station site.
 - All fuel nozzles should have automatic shutoff valves installed to prevent overfilling and spills.
 - All fueling stations should have an emergency spill kit present that contains adequate supplies to address a typical small vehicular fuel spill.
 - The spill kit at this facility is located in a container by the fuel pumps.
 - Fuel stations should be designed to prevent runoff from the station during a spill or run-on of stormwater through the fueling station.
 - If the fueling station was not designed to prevent stormwater contact with any oils or other pollutants, identify areas where potential run-on or runoff can occur, and install additional BMPs in the area to minimize the contact the fueling station has with stormwater.
 - Ensure that emergency shutoff switches and valves are clearly labeled, and that they are easy to identify, even to users who are not trained or familiar with the fuel island.
 - Do not use hoses to wash or spray down the fueling area. Only use dry methods to clean any debris or material.
- Fueling vehicles or equipment from portable containers has a similar set of concerns to fuel islands, but with a few additional conditions:
 - Be aware of where the vehicle or equipment is being fueled. Do not fuel vehicles and equipment over channelized conveyances (gutters) or storm drain inlets.
 - If fueling over those areas is unavoidable, cover all storm drain inlets that could receive liquid, and berm or dam any channelized conveyance to prevent runoff from the area.
 - Do not overfuel or top off vehicles while fueling.
 - Keep an emergency spill kit onsite to assist with an accidental leak or spill.
- Keep fueling areas free from any litter or debris that could be contaminated by oil if a leak or spill were to occur. Use dry methods to keep the area clear; do not use hoses to spray or wash down the area.
 - Provide trash containers in the area for waste and debris.

- Oil absorbent materials, such as socks, pads, or ground material, can be disposed of to the landfill so long as they do not have oil flowing freely or dripping off the used material. Do not mix used oil absorbent materials with other listed hazardous materials.
 - Listed hazardous materials are found in Attachment D: Hazardous Materials References of the facility's Stormwater Pollution Prevention Plan (SWPPP).

Inspections and Maintenance

- During the Weekly Visual and Quarterly Comprehensive Stormwater Inspections, inspect all fueling areas, islands, or fixed vehicle and equipment fueling areas, and fuel storage areas.
 - Look for any drips, spills, staining around these areas. If any exist, look for the source of the spills and correct the problem.
 - If there is evidence that the fuel containers, waste bins, or hose nozzles are leaking, they will need to be repaired or replaced. Contact State Fuel for any problems regarding the fuel island. Clean the affected areas using oil absorbent material. Properly dispose of the absorbent.
 - If there is no evidence that indicates a source, spills may be from overfilling, or leaking vehicles. Clean the affected area using oil absorbent material, then properly dispose of the absorbent.
 - Look for any evidence of runoff or run-on to the fueling station. If there is staining present that leads off, or onto the fueling area, it can indicate a need to manage BMP's around the fueling area and to redirect stormwater away from the area.
 - Check for a spill kit near the fueling area. If the spill kit is missing, or depleted, refill or replace the spill kit.
 - Look for drip pans or other containment for oil leaks at the fueling site. If they are damaged or missing, replace them.
- During the Weekly Visual and Quarterly Comprehensive Stormwater Inspections, inspect all areas where vehicles or equipment are stored.
 - If the site fuels vehicles where they are stored instead of fueling them at a fueling station, inspect the area for any leaks, spills, or drips. Clean any leaks or drips that may have occurred from fueling.
 - If the vehicles appear to be leaking or dripping fluid, use an oil absorbent to clean the area and place drip pans under the vehicles to collect leaked fluids.
 - Check the vehicle storage area for an emergency spill kit. If there is no spill kit, or it is depleted, refill or replace it.

Documentation

- The locations of any vehicle or equipment fueling stations should be identified on the site map within the SWPPP.
- If a spill or leak of vehicle fluids, fuel, or oil leaves the fueling area and enters the storm drain system, it is a violation of the UDOT MS4 permit, and must be documented.

- Immediately stop the flow of the pollutants and prevent the source from discharging more material. Then clean the area using available emergency spill kits.
- Using the Weekly Visual Inspection form, you may document the incident and its resolution.

Vehicle and Equipment Maintenance SOP

Purpose

- The purpose of this SOP is to identify methods to reduce and eliminate pollutants associated with maintenance of vehicles and equipment at UDOT facilities.

Pollutants and BMPs

- Pollutants associated with vehicle and equipment maintenance: oil and petroleum products, heavy metals, nutrients, solvents and degreasers
- List of BMPs in place: oil/water separator, spill kit, drip pans

Facility Considerations

- Wherever feasible, all maintenance done on vehicles and equipment should be done under cover.
 - If the maintenance facility does not have cover to perform maintenance on vehicles and equipment, the facility should consider only performing maintenance on dry days with no chance of precipitation and/or coordinate with a nearby UDOT facility to use their covered bays.
 - If not feasible to perform the work elsewhere, use secondary containment like drip pans and oil pans.
- Before any maintenance is done on vehicles and equipment, ensure that they are empty of any fluids that they may be holding in the tank.
 - Check any tank volume gauges and ensure that they read at zero or empty and conduct a physical inspection of the tank to view if any fluids are still in the tank.
 - If there is still fluid in the tank of the vehicle, dispose of that fluid in the proper holding tank or disposal location.
 - This facility has a holding tank or area for disposal of fluid not located onsite.
- Certain oils, when combined with water, can pass through an oil/water separator. Ensure that the vehicle or equipment that requires maintenance does not contain any emulsion fluids that can pass through an oil/water separator.
 - Oils and products that emulsify and pass through an oil/water separator include: TSS-1 oil, tack coat oil, chip oil, asphalt polymer treatment, flush oil
- During the course of maintenance, ensure that pollution prevention measures are in place.
 - Drip pans, containment units, or other measures must be in place before work begins.
 - Emergency spill control measures such as oil absorbent, berms, and hydrocarbon mats must be on hand during maintenance so that response to any kind of spill or leak can be immediate and minimize pollutant discharges.
- If maintenance is performed outside, cover nearby storm drain inlets that could receive runoff from oil and other fluids. Do not perform maintenance on top of channelized conveyances or on top of a storm drain inlet for any reason.
- While cleaning vehicle or equipment maintenance areas, use dry methods unless the area is connected to an oil water separator and a sanitary sewer and that connection has been confirmed and documented as part of the facility SWPPP.
 - The main building can be used for this purpose.

- Some facilities may have a vault that can contain and hold any liquid and a switch that can pump that liquid to sanitary sewer when turned on.
 - This facility has no vault with a switch or pump to contain waste liquid onsite.
 - If the spilled material passes through the oil water separator, turn the switch off in order to stop the pumping of waste oil to the sanitary sewer system and ensure the proper cleaning is conducted.
- All waste fluid generated during the course of maintenance should be stored in a leak proof container, with a lid and stored in the proper covered location when maintenance activities are finished.
 - Waste containers are stored in the main building.

Inspections

- During the Weekly Visual and Quarterly Comprehensive Stormwater Inspections, inspect all vehicles and significant equipment to assess their condition.
 - For certain types of vehicles, such as diesel vehicles, drips and leaks are inevitable and not always a sign that something is broken. For such vehicles, drip pans, bibs, or other oil containment units should always be in place. This does not exempt these vehicles from being inspected, as the drips and leaks can cause a potential illicit discharge.
 - Any vehicles and equipment that are prone to leaks must never be stored near or on stormwater conveyance systems, or in areas that are prone to flooding. The ideal location for such vehicles should be under cover, or in a building with a sanitary sewer connection or a treatment BMP.
 - All vehicle and equipment maintenance areas should be inspected during each inspection. Look for:
 - Fresh, wet staining in the area from any maintenance performed. This is typically caused by leaks and drips from vehicles, or small spills that occur during maintenance. Apply absorbent, and allow it to soak up the material, then dispose of the absorbent material properly.
 - A spill kit in the area that is stocked with sufficient materials. If the spill kit is empty or missing, refill or replace the kit.
 - Tracking of any potential pollutants out of the area. Apply absorbent to tracked oil, sweep up any debris that may be present, and provide drip pans to collect any future drips or leaks in the area.
 - Any waste fluid containers that are leaking, missing lids, or have rust, defects, or punctures. If there are any defects in the containers or missing lids, replace them and clean any liquid that may have spilled using absorbent.
- Before using any equipment or vehicles, perform a pre-trip or walkaround inspection.
- Any spills discovered, whether it be to the storm drain system or the sanitary sewer system, proper spill control procedures must be implemented and notification to the Region Stormwater Program Coordinator and Area Supervisor via the Weekly Inspection Form or direct contact is necessary. **If the spill reaches the storm drain system or sanitary system, notification to the Division of Water Quality or the local entity in charge of sanitary sewer system is necessary and must be done immediately. Additionally, the local**

POTW and DWQ must be notified in writing within 5 days after the immediate notification.

- **Inspect oil water separators monthly to make sure they are in working condition. Clean them at a minimum of every six months or as directed by the approved pretreatment program in your area if applicable.**
- Inspect and maintain any treatment BMPs and make sure they are in proper working condition.
- Inspect and maintain any pumps that are associated with treatment BMPs.

Documentation

- The facility SWPPP should contain the locations of all dedicated vehicle maintenance areas and the location of all emergency spill kits in the facility.
 - If the site adds, removes, or changes the locations of spill kits and maintenance areas, those changes must be reflected in the SWPPP.
- All spills and leaks should be contained and cleaned up. A Weekly Visual Inspection form should then be filled out and include the corrective actions to remedy the spill or leak.
- Document and maintain records of when the facility's oil water separator has been pumped out and cleaned by either UDOT staff or contracted professionals. These records must be maintained for at least a minimum of 5 years.

Vehicle and Equipment Washing SOP

Purpose

- This Standard Operating Procedure will lay out operational notes and site considerations to eliminate illegal/illicit discharges from vehicle and equipment washing operations at UDOT facilities.
- Vehicles used in UDOT Maintenance Operations may accumulate a variety of pollutants during their use in the right of way. It is important to ensure that during the process of washing vehicles and equipment that any pollutants brought back to the facility are only discharged to approved locations such as the sanitary sewer or retention pond.

Pollutants and BMPs

- Pollutants associated with vehicle and equipment washing: petroleum products, sediment, total suspended solids, heavy metals, litter, and debris
- List of BMPs in place: retention pond, oil/water separator, berm

Site Considerations

- In order to wash vehicles at UDOT facilities, the appropriate sanitary sewer connection or retention pond must be in place to receive the contaminated washwater. Vehicle washwater cannot be allowed to enter the storm drain system or groundwater as a result of UDOT activities. All vehicle washwater must be captured and contained.
 - Many UDOT facilities either have a retention pond, or a dedicated sanitary sewer connection that receives washwater from vehicle washing operations. This facility utilizes a retention pond to capture washwater.
- If the facility has a wash rack installed to assist with vehicle washing, ensure that it is sited so that all washwater from washing operations flows into the retention pond to capture the contaminated washwater.
 - For wash racks, ensure that vehicles are parked in the appropriately designated location of the wash rack. Oftentimes, wash racks are sited at grade breaks that drain towards the sanitary sewer connection or retention pond on one side of the rack. Ensure that the vehicle is parked on the correct side to direct flow into properly. This facility's wash rack is located on the berm, northeast of the retention pond. Vehicles must be washed on the south side/ retention pond side of the wash rack.
- If the facility allows washwater runoff to enter a retention pond as a means of containment, the facility is responsible for keeping the pond from overflowing. Runoff from a retention pond that leaves the facility, or enters groundwater (by settling on dirt or vegetation) is an illegal discharge and a violation of UDOT's MS4 permit. A need to wash vehicles is not an acceptable reason to allow retention ponds to overflow.
 - If the pond is at risk of overflowing, reduce the volume of water that is used in vehicle washing, or consider washing vehicles at an alternate location until the water level drops.
 - If climate conditions prevent evaporation, and vehicle washing cannot be reduced or suspended, water can be pumped from the retention pond and taken to another UDOT facility that can accept the wastewater, or disposed of at an appropriate licensed waste

facility. If pumping is necessary it is advisable to drain and clean the pond during the summer season if possible to avoid further costly occurrences.

- Keep all wash rack areas free of trash, salt, sand, and sediment. This will reduce the amount of solids that enter the sanitary sewer or the retention pond and will reduce its maintenance.
- Do not wash vehicles or equipment on pervious surfaces, like dirt or vegetation. Non-stormwater discharges to groundwater are a violation of the UDOT MS4 permit.

Inspections

- During the weekly and quarterly inspections, inspect all vehicle and equipment washing stations onsite.
- Inspect the vehicle wash area for the features specific to the facility:
 - Is all washwater draining from the wash area to the retention pond? If washwater is either not reaching or not captured by the retention pond, it will be necessary to wash vehicles in a different location, or install BMPs to change the washwater flow path to ensure it reaches the retention pond.
 - Berms can be a simple way to change the flow path of washwater.
 - Is the wash rack situated in such a way that it drains to the appropriate receiving body?
 - If the runoff from the wash rack is not completely captured by either the retention pond or the sanitary sewer connection, it will be necessary to change the location of the wash rack, or to change the location where vehicles are washed in the wash rack.
 - Is the retention pond overflowing, or close to overflowing? If so, immediately notify your Area Supervisor and suspend or reduce vehicle washing until a solution can be implemented.
- Is there waste, salt, sediment, debris, or other pollutants on the wash pad? If so, clean the area, and properly dispose of the waste. Minimizing the amount of pollutants that is allowed to enter the pond or the sanitary sewer will make maintenance of those systems easier, less costly, and more effective.

Documentation

- All vehicle and equipment wash areas must be identified on the site map in the facility Stormwater Pollution Prevention Plan (SWPPP)
 - If the site changes the setup for vehicle washing, the SWPPP must be updated to reflect that change. Contact your region Stormwater Program Coordinator to notify them of needed changes to the SWPPP map.
- Any agreements to pump washwater from overflowing, or nearly overflowing, retention ponds must be documented and kept with the SWPPP. Records of where the washwater is disposed or transported to must be kept with the SWPPP, as the facility is responsible for ensuring that the contaminated water is disposed of correctly.
- Keep records of all staff members who have been trained on the proper washing procedures in the SWPPP and record in the Training Log section of the SWPPP.

ATTACHMENT C:
Inspection Documentation

Information Recorded in UDOT Facility Weekly Visual Inspection

Inspection and Facility Information

- Time and Date of Inspection
- Inspector Name
- Email
- Username
- UDOT Region
- UDOT Facility

Weekly Visual Inspection

- Did this facility have any spill(s), leak(s), or other deficiencies?
- Please select the type of deficiency that occurred.
 - If other, describe the spill(s), leak(s), or other deficiencies identified.
- What was the approximate quantity of spilled or leaked material?
- Is the spill, leak, or other deficiency contained on-site?
- What corrective actions were taken to immediately remedy the spill, leak, or other deficiencies?
 - If no, what circumstances prevented immediate corrective actions to be taken to remedy the spill, leak, or other deficiency?
 - What corrective actions were later taken to remedy the spill, leak, or other deficiency?

Notes, Photos, and Signature

Information Recorded in UDOT Facility Quarterly Stormwater Discharge Inspection

Inspection and Facility Information

- Time and Date of Inspection
- Inspector Name
- Email
- Username
- UDOT Region
- UDOT Facility

Stormwater Discharge Questions

- What is the source of runoff?
- Stormwater discharge odor:
 - If "other" odor, please describe:
- Stormwater discharge color:
 - If "other" color, please describe:
- Stormwater discharge clarity:
 - If "other" clarity, please describe:
- Stormwater discharge floatables:
 - If "other" floatables, please describe:
- Does the stormwater discharge appear to be contaminated?
 - If yes, what is the likely source of the contamination?
- What corrective actions were taken to immediately eliminate the source(s) of contamination?

Completion Previous Quarter

- Did this maintenance station perform the Quarterly Visual Observation of Stormwater Discharge Inspection during last quarter?
 - Please choose the reason why an inspection was NOT completed last quarter.

Notes, Photos, and Signature

Information Recorded in UDOT Facility Quarterly Comprehensive Stormwater Inspection

Inspection and Facility Information

- Time and Date of Inspection
- Inspector Name
- Email
- Username
- UDOT Region
- UDOT Facility

General Facility Information

- Are the facility buildings in good maintenance?
 - If no, please describe:
- Are equipment storage areas maintained in a clean and orderly manner?
 - If no, please describe:
- Is the facility water supply system and culinary plumbing system in proper working order?
 - If no, please describe:
- Are spill kits and/or spill cleanup materials located onsite?
 - If no, please describe why this facility does not need spill clean up kits or materials:
- If this facility has a salt shed or salt storage, is all salt contained within the structure?
 - If no, please describe:

Sanitary Sewer and Septic System

- Select the sanitary waste system of this facility.
- Is the sanitary sewer system in proper working order?
 - If no, please describe:
- Is the septic system in proper working order?
 - If no, please describe:
- Is the sewage vault system in proper working order?
 - If no, please describe:

Landscape and Irrigation

- Does this facility have landscaping and/or irrigation?
- Is the irrigation system functioning properly (no leaks, breaks, etc.)?
 - If no, please describe:
- Are there any physical indicators of irrigation system runoff (sediment trails, pavement discoloration, etc.)?
 - If yes, please describe:
- If landscaping and/or vegetation is used as a BMP for erosion control, are the BMPs properly maintained?
 - If no, please describe:

Outdoor Surfaces (asphalt/concrete, dirt/vegetation)

- Are the impervious surfaces (asphalt/concrete) free of spills or leaks from pollutants?
 - If no, please describe:
- Are the pervious surfaces (dirt/vegetation) free of spills or leaks from pollutants?
 - If no, please describe:

Stormwater Drainage System

- Does the facility have a stormwater conveyance system?
- Is the stormwater conveyance system properly maintained?
 - If no, please describe:
- Does this facility have stormwater treatment BMPs?
- Are stormwater treatment BMPs properly maintained?
 - If no, please describe:

Non-Hazardous Waste Storage

- Does this facility have a trash container?
- Is the trash container located a reasonable distance away from a storm drain inlet?
 - If no, please describe:
- For waste containers with discharge ports near the bottom, are the ports plugged or sealed to prevent pollutant discharge?
 - If no, please describe:
- Does the trash container have a lid and is it kept closed?
 - If no, please describe:
- Does this facility accept or store street sweeper waste?
- Are street sweepings contained to prevent wind dispersion?
 - If no, please describe:
- Are street sweepings contained so that stormwater contact does not flow offsite, onto ground, or into the stormwater conveyance system?
 - If no, please describe:
- Does this facility accept or store vector waste?
- Is vector waste contained to prevent wind dispersion?
 - If no, please describe:
- Is vector waste contained so that stormwater contact does not flow offsite, onto ground, or into the stormwater conveyance system?
 - If no, please describe:

Hazardous Material and Waste Storage

- Does this facility store or use hazardous material or waste?
- Do hazardous materials and wastes have spill containment BMPs?
- Are there spills or leaks in the area surrounding the spill containment?
 - If yes, please describe:
- Are there spills or leaks in the area surrounding the hazardous materials or waste?
 - If yes, please describe:
- For hazardous materials and waste stored outdoors, are these items stored off the ground, covered to prevent contamination of stormwater, and placed in containment?
 - If no, please describe:
- Are hazardous materials and waste stored and loaded a reasonable distance away from storm drain inlets?
 - If no, please describe:

Outdoor Storage of Raw Materials

- Does this facility store raw materials outdoors?
- Are raw material storage areas located away from stormwater drainage paths or storm drain inlets?
 - If no, please describe:
- Is the stockpile maintained so that material is less likely to erode?
 - If no, please describe:

Vehicle and Equipment Maintenance and Repair

- Does this facility have a vehicle and equipment maintenance area?
- Is there a readily accessible spill kit (with ample supplies) located in the vehicle and equipment maintenance areas to cleanup typical shop spills/leaks?
 - If no, please describe:
- Are the vehicle and equipment maintenance areas clean and organized?
 - If no, please describe:
- Are used cleanup materials and wastes removed and properly disposed of after use?
 - If no, please describe:
- Are BMPs used under leaking vehicles and equipment to prevent pooling spills and tracking?
 - If no, please describe:
- Are vehicle fluids prevented from leaving the maintenance area and discharging to drainage paths, storm drain systems, etc.?
 - If no, please describe:
- Are hazardous materials in the equipment maintenance area stored with spill containment?
 - If no, please describe:
- Is the area surrounding the spill containment free of spills/leaks?
 - If no, please describe:
- Are hazardous wastes stored in sealed containers?
 - If no, please describe:

Fuel Island & Aboveground Tanks - Leak and Spill Control

- Does this facility have aboveground tanks and/or a fuel island?
- Does the fuel island have a spill kit (with ample supplies) readily accessible for small vehicular spills?
 - If no, please describe:
- Are used cleanup materials and waste removed and properly disposed of from the fueling area?
 - If no, please describe:
- Are proper fueling and spill cleanup instructions posted at the fueling area?
 - If no, please describe:
- Are automatic shutoff valves installed at each fueling pump?
 - If no, please describe:
- Are manual/emergency shutoff valves present at the fuel island?
 - If no, please describe:
- Are fuel pumps, hoses, and nozzles clean and free from leaks?
 - If no, please describe:
- Is there a spill containment system around aboveground fuel tanks?
 - If no, please describe:
- Is the spill containment system free of rainwater and spills/leaks?
 - If no, please describe:
- If a drain valve is present, is the spill containment drain valve closed?
 - If no, please describe:
- Are aboveground tanks located (or BMP controls in place) to prevent spilled fluids from discharging to drainage paths, storm drain systems, or watercourses?
 - If no, please describe:
- If there is a generator on site, is its fuel stored in secondary containment?
 - If no, please describe:
- Are portable fueling tanks (gas cans) leak free?
 - If no, please describe:
- Are portable fueling tanks stored in a flammable cabinet?
 - If no, please describe:

Similar Pollutant Generating Areas

- If this facility has any other similar areas that may generate pollutants, have these areas been thoroughly inspected?
 - If no, please describe:
- Please note any issues or deficiencies found.

Illicit Discharges

- Are the facility buildings and grounds, and perimeter free of illicit discharges originating from within this facility?
 - If no, please describe:

Notes, Photos, and Signature

Using the Survey123 App for Stormwater Inspections

Downloading and Submitting Public Surveys

Purpose:

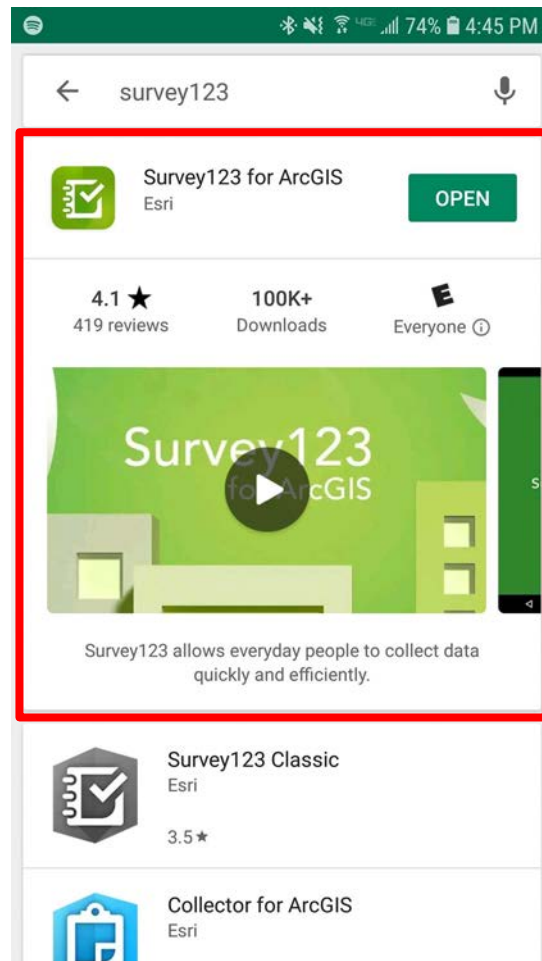

The stormwater team uses Survey123 app for Weekly Visual, Quarterly Comprehensive, and Quarterly Discharge stormwater inspections. Survey123 is compatible with mobile devices and allows you to complete inspections in areas without a reliable internet connection. Survey123 also allows you to add pictures, location, and other features not available in the Google Forms platform. This SOP has 2 sections:

- A. Getting Started with Survey123: Downloading the Survey123 app and Downloading Inspection Forms
- B. Completing and Submitting Inspections in Survey123

A. Getting Started with Survey123

Downloading the Survey123 app

1. Open the App Store or Google Play Store and search “Survey123”. Install the Survey123 app.

Accessing Forms in Survey123

1. All Maintenance Station and POE SWPPP inspections can be accessed at the following links.
 - a. **Maintenance Station SWPPP Inspections**
 - i. Weekly Visual Inspection: <https://arcg.is/GK548>
 - ii. Quarterly Stormwater Discharge Inspection: <https://arcg.is/5SXbD>
 - iii. Quarterly Comprehensive Inspection: <https://arcg.is/eCP41>
 - b. **POE SWPPP Inspections**
 - i. POE Weekly Visual Inspection: <https://arcg.is/Oq0GW5>
 - ii. POE Quarterly Stormwater Discharge Inspection: <https://arcg.is/ODWzji>
 - iii. POE Quarterly Comprehensive Inspection: <https://arcg.is/1W9uH>
2. The links will bring you to a webpage that looks like this:

- If you are using a **phone or tablet**, select **“Open in the Survey123 field app”**. It will bring you to the following page:

- **Select Open in the Survey123 field app again.**

3. **Your device will open the Survey123 app and download the survey to your phone.** The survey will now be in your “My Surveys” homepage in the Survey123 app. **Next time you need to submit an inspection, you can go directly to the app.**

4. Make sure that the inspections that you have downloaded have the correct logos.

Maintenance Station Inspections have all BLUE logos

**SWPPP
Weekly
Visual
Inspection**

**Quarterly
Stormwater
Discharge
Inspection**

**Quarterly
Comprehensive
Stormwater
Inspection**

POE Inspections have all RED logos

**POE
Weekly
Visual
Inspection**

**POE
Quarterly
Stormwater
Discharge
Inspection**

**POE
Quarterly
Comprehensive
Stormwater
Inspection**

Downloading Updates to Survey Forms in Survey123

Occasionally, there may be improvements made to the Survey123 forms. When this happens, you will need to **download updates to the form** so that you are using the updated version. **If you fill out an old version when a form has been updated, you will be unable to submit the old version of the form.**

You will be notified by **email or text message when there is a new version** that needs to be updated. **A new link will be provided** along with the email or text. **Click the new link and follow steps 2-4 above to download the updated form.**

B. Completing and Submitting Inspections in Survey123

Completing an Inspection Form in Survey123

1. From the “My Surveys” page, tap the icon of the inspection that you need to complete.
2. Tap the “Collect” button at the bottom of the page.

3. Fill out the information requested on the form. **Fields that are required have a red asterisk (*)**. You will not be able to submit the form if these fields are not complete. The date and time that you are filling out the form is automatically recorded.
4. Once you have **completed the form**, tap the **green check mark** in the lower right corner to submit the inspection form.

Thank you for completing the Quarterly Comprehensive Inspection. Please submit inspections for any satellite sheds you are also responsible for.

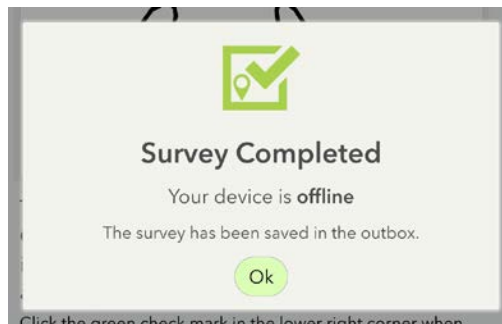

Click the green check mark in the lower right corner when complete. Then click "Send Now" to submit this inspection if online. If not online, the inspection will be saved in the "Outbox" to be uploaded later.

5. If you are connected to cellular data or wifi, you should click the **“Send Now”** button.

6. If your device is **not connected to cellular data or wifi**, you will get a message telling you that the device is offline and the form will be **saved to your outbox**.

7. Back on your home “My Surveys” screen, in the top right corner of the inspection form icon, you will see a **small green circle with a number in it**. This means that **you have a survey in the Outbox that is waiting to be submitted**.

8. When you are connected to Wifi or have cellular data coverage, you will need to **submit any inspections that are in this outbox**. To do this, tap the survey icon, and tap the **“Outbox”** icon at the bottom of the survey page.

9. **If you need to go back and edit** anything you entered in the form, **tap the entry**.

10. To submit from the **Outbox**, tap the green **“Send”** button in the bottom right corner. When your outbox is empty, you should no longer see the outbox icon on the Inspection form page and there will be no green circle with numbers on your home page.

**ATTACHMENT D:
Hazardous Materials References**

DOT Definition of Hazardous Material:

Any substance that poses an unreasonable risk to life, the environment, or property when not properly contained. A hazardous material is further defined as any substance or material that could adversely affect the safety of the public, handlers, or carriers during transportation.

There are nine classes of hazardous materials:

| | |
|---|---|
| Hazard Class 1: Explosives | 1.1 mass explosion hazard 1.2 projectile hazard 1.3 minor blast/projectile/fire 1.4 minor blast 1.5 insensitive explosives 1.6 very insensitive explosives |
| Hazard Class 2: Compressed Gases | 2.1 flammable gases 2.2 non flammable compressed 2.3 poisonous, toxic |
| Hazard Class 3: Flammable Liquids | Flammable (flash point below 141°) Combustible (flash point 141°-200°) |
| Hazard Class 4: Flammable Solids | 4.1 flammable solids 4.2 spontaneously combustible 4.3 dangerous when wet |
| Hazard Class 5: Oxidizers and Organic Peroxides | 5.1 Oxidizer 5.2 Organic Peroxide |
| Hazard Class 6: Toxic Materials | 6.1 Material that is poisonous 6.2 Infectious Agents |
| Hazard Class 7: Radioactive Material | Radioactive I Radioactive II Radioactive III |
| Hazard Class 8: Corrosive Material | Destruction of the human skin Corrode steel at a rate of 0.25 inches per year |
| Hazard Class 9: Miscellaneous | A material that presents a hazard during shipment but does not meet the definition of the other classes |

ATTACHMENT E: Training Information
